## ABSTRACT

*In this paper we consider an approach to increase density of elements of a multivibrator on bipolar transistors. The considered approach based on manufacturing a heterostructure with necessity configuration, doping by diffusion or ion implantation of required areas to manufacture the required type of conductivity (*p* or *n*) in the areas and optimization of annealing of dopant and/or radiation defects to manufacture more compact distributions of concentrations of dopants. We also introduce an analytical approach to prognosis technological process.*

## KEYWORDS

*Bipolar transistors, multivibrator, increasing of density of elements of multivibrator*

## 1. INTRODUCTION

In the present time actual questions of solid state electronic devices are increasing of density of elements of integrated circuits (in this situation it is necessary to decrease dimensions of these elements), performance and reliability [1-9]. In this paper we consider an approach to manufacture more compact multivibrator based on bipolar heterotransistors. Framework the approach we consider a heterostructure with two layers, which consist of a substrate and an epitaxial layer (see Fig. 1). The epitaxial layer includes into itself several sections manufactured by using another materials (see Fig. 1). These sections have been doped by diffusion or ion implantation to obtain required type of conductivity (*n* or *p*). The doping gives a possibility to manufacture bipolar transistor framework the considered heterostructure with account the Fig. 1. After that we consider annealing of dopant and/or radiation defects. The annealing should be optimized to manufacture more compact distributions of concentrations of dopant. Main aim of the present paper is determination of conditions, which correspond to increasing of compactness and at the same time to increasing of homogeneity of distribution of concentration of dopant in enriched area.

## 2. METHOD OF SOLUTION

We determine spatio-temporal distribution of concentration of dopant by solving the following boundary problem

$$\frac{\partial C(x, y, z, t)}{\partial t} = \frac{\partial}{\partial x} \left[ D \frac{\partial C(x, y, z, t)}{\partial x} \right] + \frac{\partial}{\partial y} \left[ D \frac{\partial C(x, y, z, t)}{\partial y} \right] + \frac{\partial}{\partial z} \left[ D \frac{\partial C(x, y, z, t)}{\partial z} \right] \quad (1)$$

with boundary and initial conditions

$$\begin{aligned} \left. \frac{\partial C(x,y,z,t)}{\partial x} \right|_{x=0} = 0, \left. \frac{\partial C(x,y,z,t)}{\partial x} \right|_{x=L_x} = 0, \left. \frac{\partial C(x,y,z,t)}{\partial y} \right|_{y=0} = 0, \left. \frac{\partial C(x,y,z,t)}{\partial y} \right|_{x=L_y} = 0, \\ \left. \frac{\partial C(x,y,z,t)}{\partial z} \right|_{z=0} = 0, \left. \frac{\partial C(x,y,z,t)}{\partial z} \right|_{x=L_z} = 0, C(x,y,z,0) = f_C(x,y,z). \end{aligned}$$

Here  $C(x,y,z,t)$  is the spatio-temporal distribution of concentration of dopant;  $T$  is the temperature of annealing;  $D_C$  is the dopant diffusion coefficient. Value of dopant diffusion coefficient depends on properties of materials of heterostructure, speed of heating and cooling of heterostructure (with account Arrhenius law). Dependences of dopant diffusion coefficient on parameters could be approximated by the following relation [10-12]

$$D_c = D_L(x, y, z, T) \left[ 1 + \xi \frac{C^\gamma(x, y, z, t)}{P^\gamma(x, y, z, T)} \right] \left[ 1 + \zeta_1 \frac{V(x, y, z, t)}{V^*} + \zeta_2 \frac{V^2(x, y, z, t)}{(V^*)^2} \right], \quad (3)$$

where  $D_L(x, y, z, T)$  is the spatial (due to presents several layers in heterostructure) and temperature (due to Arrhenius law) dependences of dopant diffusion coefficient;  $P(x, y, z, T)$  is the limit of solubility of dopant; parameter  $\gamma$  depends on properties of materials and could be integer in the following interval  $\gamma \in [1, 3]$  [10];  $V(x, y, z, t)$  is the spatio-temporal distribution of concentration of radiation vacancies;  $V^*$  is the equilibrium distribution of concentration of vacancies.

Concentrational dependence of dopant diffusion coefficient has been described in details in [10]. Using diffusion type of doping did not generation radiation defects. In this situation  $\zeta_1 = \zeta_2 = 0$ . We determine the spatio-temporal distributions of concentrations of radiation defects by solving the following system of equations [11,12]

$$\begin{aligned} \frac{\partial I(x, y, z, t)}{\partial t} &= \frac{\partial}{\partial x} \left[ D_I(x, y, z, T) \frac{\partial I(x, y, z, t)}{\partial x} \right] + \frac{\partial}{\partial y} \left[ D_I(x, y, z, T) \frac{\partial I(x, y, z, t)}{\partial y} \right] - k_{I,I}(x, y, z, T) \times \\ &\quad \times I^2(x, y, z, t) + \frac{\partial}{\partial z} \left[ D_I(x, y, z, T) \frac{\partial I(x, y, z, t)}{\partial z} \right] - k_{I,V}(x, y, z, T) I(x, y, z, t) V(x, y, z, t) \quad (4) \\ \frac{\partial V(x, y, z, t)}{\partial t} &= \frac{\partial}{\partial x} \left[ D_V(x, y, z, T) \frac{\partial V(x, y, z, t)}{\partial x} \right] + \frac{\partial}{\partial y} \left[ D_V(x, y, z, T) \frac{\partial V(x, y, z, t)}{\partial y} \right] - k_{V,V}(x, y, z, T) \times \\ &\quad \times V^2(x, y, z, t) + \frac{\partial}{\partial z} \left[ D_V(x, y, z, T) \frac{\partial V(x, y, z, t)}{\partial z} \right] - k_{I,V}(x, y, z, T) I(x, y, z, t) V(x, y, z, t) \end{aligned}$$

with boundary and initial conditions

$$\begin{aligned} \left. \frac{\partial \rho(x, y, z, t)}{\partial x} \right|_{x=0} &= 0, \quad \left. \frac{\partial \rho(x, y, z, t)}{\partial x} \right|_{x=L_x} = 0, \quad \left. \frac{\partial \rho(x, y, z, t)}{\partial y} \right|_{y=0} = 0, \quad \left. \frac{\partial \rho(x, y, z, t)}{\partial y} \right|_{y=L_y} = 0, \\ \left. \frac{\partial \rho(x, y, z, t)}{\partial z} \right|_{z=0} &= 0, \quad \left. \frac{\partial \rho(x, y, z, t)}{\partial z} \right|_{z=L_z} = 0, \quad \rho(x, y, z, 0) = f_\rho(x, y, z). \end{aligned} \quad (5)$$

Here  $\rho = I, V$ ;  $I(x, y, z, t)$  is the spatio-temporal distribution of concentration of radiation interstitials;  $D_\rho(x, y, z, T)$  are the diffusion coefficients of point radiation defects; terms  $V^2(x, y, z, t)$  and  $I^2(x, y, z, t)$  correspond to generation divacancies and diinterstitials;  $k_{I,V}(x, y, z, T)$  is the parameter of recombination of point radiation defects;  $k_{I,I}(x, y, z, T)$  and  $k_{V,V}(x, y, z, T)$  are the parameters of generation of simplest complexes of point radiation defects.

We determine the spatio-temporal distributions of concentrations of divacancies  $\Phi_V(x, y, z, t)$  and dinterstitials  $\Phi_I(x, y, z, t)$  by solving the following system of equations [11,12]

$$\begin{aligned} \frac{\partial \Phi_I(x, y, z, t)}{\partial t} &= \frac{\partial}{\partial x} \left[ D_{\Phi_I}(x, y, z, T) \frac{\partial \Phi_I(x, y, z, t)}{\partial x} \right] + \frac{\partial}{\partial y} \left[ D_{\Phi_I}(x, y, z, T) \frac{\partial \Phi_I(x, y, z, t)}{\partial y} \right] + \\ &\quad + \frac{\partial}{\partial z} \left[ D_{\Phi_I}(x, y, z, T) \frac{\partial \Phi_I(x, y, z, t)}{\partial z} \right] + k_{I,I}(x, y, z, T) I^2(x, y, z, t) - k_I(x, y, z, T) I(x, y, z, t) \quad (6) \end{aligned}$$

$$\frac{\partial \Phi_V(x, y, z, t)}{\partial t} = \frac{\partial}{\partial x} \left[ D_{\Phi V}(x, y, z, T) \frac{\partial \Phi_V(x, y, z, t)}{\partial x} \right] + \frac{\partial}{\partial y} \left[ D_{\Phi V}(x, y, z, T) \frac{\partial \Phi_V(x, y, z, t)}{\partial y} \right] + \\ + \frac{\partial}{\partial z} \left[ D_{\Phi V}(x, y, z, T) \frac{\partial \Phi_V(x, y, z, t)}{\partial z} \right] + k_{V,V}(x, y, z, T) V^2(x, y, z, t) - k_V(x, y, z, T) V(x, y, z, t)$$

with boundary and initial conditions

$$\left. \frac{\partial \Phi_\rho(x, y, z, t)}{\partial x} \right|_{x=0} = 0, \left. \frac{\partial \Phi_\rho(x, y, z, t)}{\partial x} \right|_{x=L_x} = 0, \left. \frac{\partial \Phi_\rho(x, y, z, t)}{\partial y} \right|_{y=0} = 0, \left. \frac{\partial \Phi_\rho(x, y, z, t)}{\partial y} \right|_{y=L_y} = 0, \\ \left. \frac{\partial \Phi_\rho(x, y, z, t)}{\partial z} \right|_{z=0} = 0, \left. \frac{\partial \Phi_\rho(x, y, z, t)}{\partial z} \right|_{z=L_z} = 0, \Phi_l(x, y, z, 0) = f_{\phi l}(x, y, z), \Phi_V(x, y, z, 0) = f_{\phi V}(x, y, z). \quad (7)$$

Here  $D_{\phi\rho}(x, y, z, T)$  are the diffusion coefficients of the above complexes of radiation defects;  $k_l(x, y, z, T)$  and  $k_V(x, y, z, T)$  are the parameters of decay of these complexes.

To determine spatio-temporal distribution of concentration of dopant we transform the Eq.(1) to the following integro-differential form

$$\frac{xyz}{L_x L_y L_z} \int_{L_x}^x \int_{L_y}^y \int_{L_z}^z C(u, v, w, t) dw dv du = \int_0^t \int_{L_y}^y \int_{L_z}^z D_L(x, v, w, T) \left[ 1 + \xi_1 \frac{V(x, v, w, \tau)}{V^*} + \xi_2 \frac{V^2(x, v, w, \tau)}{(V^*)^2} \right] \times \\ \times \left[ 1 + \xi \frac{C^\gamma(x, v, w, \tau)}{P^\gamma(x, v, w, T)} \right] \frac{\partial C(x, v, w, \tau)}{\partial x} d\tau \frac{yz}{L_y L_z} + \frac{xz}{L_x L_z} \int_0^t \int_{L_x}^x \int_{L_z}^z D_L(u, y, w, T) \frac{\partial C(u, y, w, \tau)}{\partial y} \times \\ \times \left[ 1 + \xi_1 \frac{V(u, y, w, \tau)}{V^*} + \xi_2 \frac{V^2(u, y, w, \tau)}{(V^*)^2} \right] \left[ 1 + \xi \frac{C^\gamma(u, y, w, \tau)}{P^\gamma(x, y, z, T)} \right] d\tau + \frac{xy}{L_x L_y} \int_0^t \int_{L_x}^x \int_{L_y}^y D_L(u, v, z, T) \times \\ \times \left[ 1 + \xi_1 \frac{V(u, v, z, \tau)}{V^*} + \xi_2 \frac{V^2(u, v, z, \tau)}{(V^*)^2} \right] \left[ 1 + \xi \frac{C^\gamma(u, v, z, \tau)}{P^\gamma(x, y, z, T)} \right] \frac{\partial C(u, v, z, \tau)}{\partial z} d\tau + \frac{xyz}{L_x L_y L_z} \times \\ \times \int_{L_x}^x \int_{L_y}^y \int_{L_z}^z f(u, v, w) dw dv du. \quad (1a)$$

We determine solution of the above equation by using Bubnov-Galerkin approach [13]. Framework the approach we determine solution of the Eq.(1a) as the following series

$$C_0(x, y, z, t) = \sum_{n=0}^N a_{nC} c_n(x) c_n(y) c_n(z) e_{nC}(t),$$

where  $e_{nC}(t) = \exp[-\pi^2 n^2 D_{0C} t (L_x^{-2} + L_y^{-2} + L_z^{-2})]$ ,  $c_n(\chi) = \cos(\pi n \chi / L_\chi)$ . The above series includes into itself finite number of terms  $N$ . The considered series is similar with solution of linear Eq.(1) (i.e. with  $\xi = 0$ ) and averaged dopant diffusion coefficient  $D_0$ . Substitution of the series into Eq.(1a) leads to the following result

$$\frac{xyz}{\pi^2} \sum_{n=1}^N \frac{a_C}{n^3} s_n(x) s_n(y) s_n(z) e_{nC}(t) = - \int_0^t \int_{L_y}^y \int_{L_z}^z \left\{ 1 + \left[ \sum_{n=1}^N a_{nC} c_n(x) c_n(y) c_n(w) e_{nC}(\tau) \right]^\gamma \frac{\xi}{P^\gamma(x, v, w, T)} \right\} \times \\ \times \left[ 1 + \xi_1 \frac{V(x, v, w, \tau)}{V^*} + \xi_2 \frac{V^2(x, v, w, \tau)}{(V^*)^2} \right] D_L(x, v, w, T) \sum_{n=1}^N n a_{nC} s_n(x) c_n(v) c_n(w) e_{nC}(\tau) d\tau \frac{yz}{L_y L_z} -$$

$$\begin{aligned}
& -\frac{xz}{L_x L_z} \int_0^t \int_0^x \int_0^z \left[ 1 + \varsigma_1 \frac{V(u, y, w, \tau)}{V^*} + \varsigma_2 \frac{V^2(u, y, w, \tau)}{(V^*)^2} \right] \left\{ 1 + \left[ \sum_{m=1}^N a_{mc} c_m(u) c_m(y) c_m(w) e_{mc}(\tau) \right]^\gamma \times \right. \\
& \left. \times \frac{\xi}{P^r(u, y, w, T)} \right\} D_L(u, y, w, T) \sum_{n=1}^N n a_{nc} c_n(u) s_n(y) c_n(w) e_{nc}(\tau) d\tau - \frac{xy}{L_x L_y} \int_0^t \int_0^x \int_0^y D_L(u, v, z, T) \times \\
& \times \left\{ 1 + \frac{\xi}{P^r(u, v, z, T)} \left[ \sum_{n=1}^N a_{nc} c_n(u) c_n(v) c_n(z) e_{nc}(\tau) \right]^\gamma \right\} \left[ 1 + \varsigma_1 \frac{V(u, v, z, \tau)}{V^*} + \varsigma_2 \frac{V^2(u, v, z, \tau)}{(V^*)^2} \right] \times \\
& \times \sum_{n=1}^N n a_{nc} c_n(u) c_n(v) s_n(z) e_{nc}(\tau) d\tau + \frac{x y z}{L_x L_y L_z} \int_0^x \int_0^y \int_0^z f(u, v, w) dwdvdud,
\end{aligned}$$

where  $s_n(\chi) = \sin(\pi n \chi / L_\chi)$ . We determine coefficients  $a_n$  by using orthogonality condition of terms of the considered series framework scale of heterostructure. The condition gives us possibility to obtain relations for calculation of parameters  $a_n$  for any quantity of terms  $N$ . In the common case the relations could be written as

$$\begin{aligned}
& -\frac{L_x^2 L_y^2 L_z^2}{\pi^5} \sum_{n=1}^N \frac{a_{nc}}{n^6} e_{nc}(t) = -\int_0^t \int_0^x \int_0^y \int_0^z D_L(x, y, z, T) \left\{ 1 + \left[ \sum_{n=1}^N a_{nc} c_n(x) c_n(y) c_n(z) e_{nc}(\tau) \right]^\gamma \frac{\xi}{P^r(x, y, z, T)} \right\} \times \\
& \times \frac{L_y L_z}{2\pi^2} \left[ 1 + \varsigma_1 \frac{V(x, y, z, \tau)}{V^*} + \varsigma_2 \frac{V^2(x, y, z, \tau)}{(V^*)^2} \right] \sum_{n=1}^N \frac{a_{nc}}{n} s_n(2x) c_n(y) \left\{ y s_n(y) + \frac{L_y}{\pi n} [c_n(y) - 1] \right\} \times \\
& \times c_n(z) e_{nc}(\tau) \left\{ z s_n(z) + \frac{L_z}{\pi n} [c_n(z) - 1] \right\} d z d y d x d \tau - \int_0^t \int_0^x \int_0^y \int_0^z \left[ \sum_{n=1}^N a_{nc} c_n(x) c_n(y) c_n(z) e_{nc}(\tau) \right]^\gamma \times \\
& \times \frac{\xi}{P^r(x, y, z, T)} + 1 \right\} D_L(x, y, z, T) \left[ 1 + \varsigma_1 \frac{V(x, y, z, \tau)}{V^*} + \varsigma_2 \frac{V^2(x, y, z, \tau)}{(V^*)^2} \right] \left[ 1 + \varsigma_1 \frac{V(x, y, z, \tau)}{V^*} + \right. \\
& \left. + \varsigma_2 \frac{V^2(x, y, z, \tau)}{(V^*)^2} \right] \sum_{n=1}^N \frac{a_{nc} L_z}{2\pi^2 n} \left\{ x s_n(x) + \frac{L_x}{\pi n} [c_n(x) - 1] \right\} \left\{ z s_n(z) + \frac{L_z}{\pi n} [c_n(z) - 1] \right\} c_n(x) s_n(2y) c_n(z) \times \\
& \times e_{nc}(\tau) d z d y d x d \tau - \frac{L_x L_y}{2\pi^2} \times \int_0^t \int_0^x \int_0^y \int_0^z \left\{ 1 + \left[ \sum_{n=1}^N a_{nc} c_n(x) c_n(y) c_n(z) e_{nc}(\tau) \right]^\gamma \frac{\xi}{P^r(x, y, z, T)} \right\} \times \\
& \times D_L(x, y, z, T) \left[ 1 + \varsigma_2 \frac{V^2(x, y, z, \tau)}{(V^*)^2} + \varsigma_1 \frac{V(x, y, z, \tau)}{V^*} \right] \sum_{n=1}^N \frac{a_{nc}}{n} c_n(x) \left\{ x s_n(x) + \frac{L_x}{\pi n} [c_n(x) - 1] \right\} \times \\
& \times c_n(y) s_n(z) \left\{ y s_n(y) + \frac{L_y}{\pi n} [c_n(y) - 1] \right\} e_{nc}(\tau) d z d y d x d \tau + \sum_{n=1}^N \frac{L_x}{0} \left\{ x s_n(x) + \frac{L_x}{\pi n} [c_n(x) - 1] \right\} \times \\
& \times \int_0^{L_y} \left\{ y s_n(y) + \frac{L_y}{\pi n} [c_n(y) - 1] \right\} \int_0^{L_z} \left\{ z s_n(z) + \frac{L_z}{\pi n} [c_n(z) - 1] \right\} f(x, y, z) d z d y d x.
\end{aligned}$$

As an example for  $\gamma=0$  we obtain

$$\begin{aligned}
a_{nc} = & \int_0^{L_x} \int_0^{L_y} \left\{ y s_n(y) + \frac{L_y}{\pi n} [c_n(y) - 1] \right\} \int_0^{L_z} \left\{ z s_n(z) + \frac{L_z}{\pi n} [c_n(z) - 1] \right\} f(x, y, z) d z d y \left\{ x s_n(x) + \frac{L_x}{\pi n} \times \right. \\
& \times [c_n(x) - 1] \} d x \left( \frac{n}{2} \int_0^t \int_0^x \int_0^y s_n(2x) \int_0^{L_y} c_n(y) \int_0^{L_z} c_n(z) D_L(x, y, z, T) \left\{ z s_n(z) + \frac{L_z}{\pi n} [c_n(z) - 1] \right\} \{ y s_n(y) + \right. \\
& \left. \left. + \frac{L_y}{\pi n} [c_n(y) - 1] \right\} \left[ 1 + \varsigma_1 \frac{V(x, y, z, \tau)}{V^*} + \varsigma_2 \frac{V^2(x, y, z, \tau)}{(V^*)^2} \right] \left[ 1 + \frac{\xi}{P^r(x, y, z, T)} \right] c_n(z) d z d y d x \times \right)
\end{aligned}$$

$$\begin{aligned}
 & \times e_{nC}(\tau) d\tau + \int_0^t e_{nC}(\tau) \int_0^{L_x} c_n(x) \left\{ x s_n(x) + \frac{L_y}{\pi n} [c_n(x) - 1] \right\} \int_0^{L_y} s_n(2y) \int_0^{L_z} c_n(z) \left\{ z s_n(z) + \frac{L_y}{\pi n} [c_n(z) - 1] \right\} \times \\
 & \times D_L(x, y, z, T) \left[ 1 + \frac{\xi}{P^*(x, y, z, T)} \right] \left[ 1 + \zeta_1 \frac{V(x, y, z, \tau)}{V^*} + \zeta_2 \frac{V^2(x, y, z, \tau)}{(V^*)^2} \right] dz dy dx d\tau + \\
 & + \int_0^t e_{nC}(\tau) \int_0^{L_x} c_n(x) \left\{ x s_n(x) + \frac{L_x}{\pi n} [c_n(x) - 1] \right\} \int_0^{L_y} c_n(y) \left\{ y s_n(y) + \frac{L_y}{\pi n} [c_n(y) - 1] \right\} \int_0^{L_z} D_L(x, y, z, T) \times \\
 & \times s_n(2z) \left[ 1 + \frac{\xi}{P^*(x, y, z, T)} \right] \left[ 1 + \zeta_2 \frac{V^2(x, y, z, \tau)}{(V^*)^2} + \zeta_1 \frac{V(x, y, z, \tau)}{V^*} \right] dz dy dx d\tau \left\{ - \frac{L_z^2 L_y^2 L_z^2}{\pi^5 n^6} \right\}^{-1}.
 \end{aligned}$$

For  $\gamma=1$  one can obtain the following relation to determine required parameters

$$\begin{aligned}
 a_{nC} = & -\frac{\beta_n}{2\alpha_n} \pm \sqrt{\beta_n^2 + 4\alpha_n \int_0^{L_x} c_n(x) \int_0^{L_y} c_n(y) \int_0^{L_z} c_n(z) f(x, y, z) dz dy dx}, \\
 \text{where } \alpha_n = & \frac{\xi L_y L_z}{2\pi^2 n} \int_0^t \int_0^{L_x} s_n(2x) \int_0^{L_y} c_n(y) \int_0^{L_z} D_L(x, y, z, T) \left[ 1 + \zeta_1 \frac{V(x, y, z, \tau)}{V^*} + \zeta_2 \frac{V^2(x, y, z, \tau)}{(V^*)^2} \right] \times \\
 & \times c_n(z) \left\{ y s_n(y) + \frac{L_y}{\pi n} [c_n(y) - 1] \right\} \left\{ z s_n(z) + \frac{L_z}{\pi n} [c_n(z) - 1] \right\} dz dy dx e_{nC}(\tau) d\tau + \frac{\xi L_x L_z}{2\pi^2 n} \times \\
 & \times \int_0^t e_{nC}(\tau) \int_0^{L_x} c_n(x) \left\{ x s_n(x) + \frac{L_x}{\pi n} [c_n(x) - 1] \right\} \int_0^{L_y} s_n(2y) \int_0^{L_z} D_L(x, y, z, T) \left\{ z s_n(z) - \frac{L_z}{\pi n} [c_n(z) - 1] \right\} \times \\
 & \times c_n(z) \left[ 1 + \zeta_1 \frac{V(x, y, z, \tau)}{V^*} + \zeta_2 \frac{V^2(x, y, z, \tau)}{(V^*)^2} \right] dz dy dx d\tau + \frac{\xi L_x L_y}{2\pi^2 n} \int_0^t e_{nC}(\tau) \int_0^{L_x} c_n(x) \int_0^{L_y} c_n(y) \times \\
 & \times \int_0^{L_z} s_n(2z) \frac{D_L(x, y, z, T)}{P(x, y, z, T)} \left[ 1 + \zeta_1 \frac{V(x, y, z, \tau)}{V^*} + \zeta_2 \frac{V^2(x, y, z, \tau)}{(V^*)^2} \right] \left\{ x s_n(x) + \frac{L_x}{\pi n} [c_n(x) - 1] \right\} \{ s_n(y) \times \\
 & \times y + \frac{L_y}{\pi n} [c_n(y) - 1] \} dz dy dx d\tau, \quad \beta_n = \frac{L_y L_z}{2n\pi^2} \int_0^t e_{nC}(\tau) \int_0^{L_x} s_n(2x) \int_0^{L_y} c_n(y) \int_0^{L_z} c_n(z) D_L(x, y, z, T) \times \\

 \end{aligned}$$

Analogous way could be used to calculate values of parameters  $a_n$  for larger values of parameter  $\gamma$ . However the relations will not be present in the paper because the relations are bulky. Advan-

tage of the approach is absent of necessity to join dopant concentration on interfaces of hetero-structure.

Equations of the system (4) have been also solved by using Bubnov-Galerkin approach. Previously we transform the differential equations to the following integro-differential form

$$\begin{aligned}
 & \frac{x y z}{L_x L_y L_z} \int_{L_x L_y L_z}^{x y z} I(u, v, w, t) d w d v d u = \frac{y z}{L_y L_z} \int_0^t \int_{L_y L_z}^{y z} D_I(x, v, w, T) \frac{\partial I(x, v, w, \tau)}{\partial x} d w d v d \tau + \frac{x z}{L_x L_z} \times \\
 & \quad \times \int_0^t \int_{L_x L_z}^{x z} D_I(u, y, w, T) \frac{\partial I(u, y, w, \tau)}{\partial x} d w d u d \tau + \frac{x y}{L_x L_y} \int_0^t \int_{L_x L_y}^{x y} D_I(u, v, z, T) \frac{\partial I(u, v, z, \tau)}{\partial z} d v d u d \tau - \\
 & \quad - \frac{x y z}{L_x L_y L_z} \int_{L_x L_y L_z}^{x y z} k_{I,V}(u, v, w, T) I(u, v, w, t) V(u, v, w, t) d w d v d u - \frac{x y z}{L_x L_y L_z} \int_{L_x L_y L_z}^{x y z} k_{I,I}(u, v, w, T) \times \\
 & \quad \times I^2(u, v, w, t) d w d v d u + \frac{x y z}{L_x L_y L_z} \int_{L_x L_y L_z}^{x y z} f_I(u, v, w) d w d v d u \quad (4a) \\
 & \frac{x y z}{L_x L_y L_z} \int_{L_x L_y L_z}^{x y z} V(u, v, w, t) d w d v d u = \frac{y z}{L_y L_z} \int_0^t \int_{L_y L_z}^{y z} D_V(x, v, w, T) \frac{\partial V(x, v, w, \tau)}{\partial x} d w d v d \tau + \frac{x z}{L_x L_z} \times \\
 & \quad \times \int_0^t \int_{L_x L_z}^{x z} D_V(u, y, w, T) \frac{\partial V(u, y, w, \tau)}{\partial x} d w d u d \tau + \frac{x y}{L_x L_y} \int_0^t \int_{L_x L_y}^{x y} D_V(u, v, z, T) \frac{\partial V(u, v, z, \tau)}{\partial z} d v d u d \tau - \\
 & \quad - \frac{x y z}{L_x L_y L_z} \int_{L_x L_y L_z}^{x y z} k_{V,V}(u, v, w, T) I(u, v, w, t) V(u, v, w, t) d w d v d u - \frac{x y z}{L_x L_y L_z} \int_{L_x L_y L_z}^{x y z} k_{V,V}(u, v, w, T) \times \\
 & \quad \times V^2(u, v, w, t) d w d v d u + \frac{x y z}{L_x L_y L_z} \int_{L_x L_y L_z}^{x y z} f_V(u, v, w) d w d v d u .
 \end{aligned}$$

Farther we determine solutions of the above equations as the following series

$$\rho_0(x, y, z, t) = \sum_{n=1}^N a_{n\rho} c_n(x) c_n(y) c_n(z) e_{n\rho}(t),$$

where  $a_{n\rho}$  are not yet known coefficients. Substitution of the series into Eqs.(4a) leads to the following results

$$\begin{aligned}
 & \frac{x y z}{\pi^3} \sum_{n=1}^N \frac{a_{nl}}{n^3} s_n(x) s_n(y) s_n(z) e_{nl}(t) = - \frac{y z \pi}{L_x L_y L_z} \sum_{n=1}^N a_{nl} \int_0^t e_{nl}(\tau) \int_{L_y}^y c_n(y) \int_{L_z}^z c_n(z) D_I(x, v, w, T) d w d v d \tau \times \\
 & \quad \times s_n(x) - \frac{x z \pi}{L_x L_y L_z} \sum_{n=1}^N a_{nl} s_n(y) \int_0^t e_{nl}(\tau) \int_{L_x}^x c_n(x) \int_{L_z}^z c_n(z) D_I(u, y, w, T) d w d u d \tau - \frac{x y \pi}{L_x L_y L_z} \sum_{n=1}^N a_{nl} s_n(z) \times \\
 & \quad \times \int_0^t e_{nl}(\tau) \int_{L_x}^x c_n(x) \int_{L_y}^y c_n(y) D_I(u, v, z, T) d v d u d \tau - \frac{x y z}{L_x L_y L_z} \int_0^t \int_{L_y L_z}^{x y z} \left[ \sum_{n=1}^N a_{nl} c_n(u) c_n(v) c_n(w) e_{nl}(t) \right]^2 \times \\
 & \quad \times k_{I,I}(u, v, w, T) d w d v d u - \frac{x y z}{L_x L_y L_z} \int_{L_x L_y L_z}^{x y z} \sum_{n=1}^N a_{nl} c_n(u) c_n(v) c_n(w) e_{nl}(t) \sum_{n=1}^N a_{nv} c_n(u) c_n(v) c_n(w) \times \\
 & \quad \times e_{nv}(t) k_{I,V}(u, v, w, T) d w d v d u + \frac{x y z}{L_x L_y L_z} \int_{L_x L_y L_z}^{x y z} f_I(u, v, w) d w d v d u \\
 & \frac{x y z}{\pi^3} \sum_{n=1}^N \frac{a_{nv}}{n^3} s_n(x) s_n(y) s_n(z) e_{nv}(t) = - \frac{y z \pi}{L_x L_y L_z} \sum_{n=1}^N a_{nv} \int_0^t e_{nv}(\tau) \int_{L_y}^y c_n(y) \int_{L_z}^z c_n(z) D_V(x, v, w, T) d w d v d \tau \times
 \end{aligned}$$

$$\begin{aligned}
 & \times s_n(x) - \frac{x z \pi}{L_x L_y L_z} \sum_{n=1}^N a_{nV} s_n(y) \int_0^t e_{nV}(\tau) \int_{L_x}^x c_n(x) \int_{L_z}^z c_n(z) D_V(u, y, w, T) d w d u d \tau - \frac{x y \pi}{L_x L_y L_z} \sum_{n=1}^N a_{nV} s_n(z) \times \\
 & \times \int_0^t e_{nV}(\tau) \int_{L_x}^x c_n(x) \int_{L_y}^y c_n(y) D_V(u, v, z, T) d v d u d \tau - \frac{x y z}{L_x L_y L_z} \int_{L_x}^x \int_{L_y}^y \int_{L_z}^z \sum_{n=1}^N a_{nV} c_n(u) c_n(v) c_n(w) e_{nV}(t) \Big|^2 \times \\
 & \times k_{v,v}(u, v, v, T) d w d v d u - \frac{x y z}{L_x L_y L_z} \int_{L_x}^x \int_{L_y}^y \int_{L_z}^z \sum_{n=1}^N a_{nV} c_n(u) c_n(v) c_n(w) e_{nV}(t) \sum_{n=1}^N a_{nV} c_n(u) c_n(v) c_n(w) \times \\
 & \times e_{nV}(t) k_{I,V}(u, v, v, T) d w d v d u + \frac{x y z}{L_x L_y L_z} \int_{L_x}^x \int_{L_y}^y \int_{L_z}^z f_V(u, v, w) d w d v d u .
 \end{aligned}$$

We determine coefficients  $a_{n\rho}$  by using orthogonality condition on the scale of heterostructure. The condition gives us possibility to obtain relations to calculate  $a_{n\rho}$  for any quantity  $N$  of terms of considered series. In the common case equations for the required coefficients could be written as

$$\begin{aligned}
 & -\frac{L_x^2 L_y^2 L_z^2}{\pi^5} \sum_{n=1}^N \frac{a_{nI}}{n^6} e_{nI}(t) = -\frac{1}{2\pi L_x} \sum_{n=1}^N \frac{a_{nI}}{n^2} \int_0^t e_{nI}(\tau) \int_0^{L_x} [1 - c_n(2x)] \int_0^{L_y} \left\{ L_y + y s_n(2y) + \frac{L_y}{2\pi n} [c_n(2y) - 1] \right\} \times \\
 & \times \int_0^{L_z} D_I(x, y, z, T) \left\{ z s_n(z) + \frac{L_z}{2\pi n} [c_n(z) - 1] \right\} d z d y d x d \tau - \frac{1}{2\pi L_y} \sum_{n=1}^N \frac{a_{nI}}{n^2} \int_0^{L_x} \int_0^{L_y} \left\{ \frac{L_x}{\pi n} [c_n(2x) - 1] + L_x + \right. \\

\end{aligned}$$

We determine spatio-temporal distributions of concentrations of complexes of radiation defects in the following form

$$\Phi_{\rho 0}(x, y, z, t) = \sum_{n=1}^N a_{n \Phi \rho} c_n(x) c_n(y) c_n(z) e_{n \rho}(t),$$

where  $a_{n \Phi \rho}$  are not yet known coefficients. Let us previously transform the Eqs.(6) to the following integro-differential form

$$\begin{aligned} & \frac{x y z}{L_x L_y L_z} \int_0^x \int_0^y \int_0^z \Phi_I(u, v, w, t) d w d v d u = \frac{y z}{L_y L_z} \int_0^y \int_0^z D_{\Phi I}(x, v, w, T) \frac{\partial \Phi_I(x, v, w, \tau)}{\partial x} d w d v d \tau + \\ & + \frac{x z}{L_x L_z} \int_0^x \int_0^z D_{\Phi I}(u, y, w, T) \frac{\partial \Phi_I(u, y, w, \tau)}{\partial y} d w d u d \tau + \int_0^x \int_0^y D_{\Phi I}(u, v, z, T) \frac{\partial \Phi_I(u, v, z, \tau)}{\partial z} d v d u d \tau \times \\ & \times \frac{x y}{L_x L_y} + \frac{x y z}{L_x L_y L_z} \int_0^x \int_0^y \int_0^z k_{I,I}(u, v, w, T) I^2(u, v, w, \tau) d w d v d u - \frac{x y z}{L_x L_y L_z} \int_0^x \int_0^y \int_0^z k_I(u, v, w, T) \times \\ & \times I(u, v, w, \tau) d w d v d u + \frac{x y z}{L_x L_y L_z} \int_0^x \int_0^y \int_0^z f_{\Phi I}(u, v, w) d w d v d u \quad (6a) \\ & \frac{x y z}{L_x L_y L_z} \int_0^x \int_0^y \int_0^z \Phi_V(u, v, w, t) d w d v d u = \frac{y z}{L_y L_z} \int_0^y \int_0^z D_{\Phi V}(x, v, w, T) \frac{\partial \Phi_V(x, v, w, \tau)}{\partial x} d w d v d \tau + \\ & + \frac{x z}{L_x L_z} \int_0^x \int_0^z D_{\Phi V}(u, y, w, T) \frac{\partial \Phi_V(u, y, w, \tau)}{\partial y} d w d u d \tau + \int_0^x \int_0^y D_{\Phi V}(u, v, z, T) \frac{\partial \Phi_V(u, v, z, \tau)}{\partial z} d v d u d \tau \times \\ & \times \frac{x y}{L_x L_y} + \frac{x y z}{L_x L_y L_z} \int_0^x \int_0^y \int_0^z k_{V,V}(u, v, w, T) V^2(u, v, w, \tau) d w d v d u - \frac{x y z}{L_x L_y L_z} \int_0^x \int_0^y \int_0^z k_V(u, v, w, T) \times \\ & \times V(u, v, w, \tau) d w d v d u + \frac{x y z}{L_x L_y L_z} \int_0^x \int_0^y \int_0^z f_{\Phi V}(u, v, w) d w d v d u . \end{aligned}$$

Substitution of the previously considered series in the Eqs.(6a) leads to the following form

$$\begin{aligned} & -x y z \sum_{n=1}^N \frac{a_{n \Phi I}}{\pi^3 n^3} s_n(x) s_n(y) s_n(z) e_{nI}(t) = -\frac{y z \pi}{L_x L_y L_z} \sum_{n=1}^N n a_{n \Phi I} s_n(x) e_{nI}(t) \int_0^y \int_0^z c_n(v) \int_0^z D_{\Phi I}(x, v, w, T) \times \\ & \times c_n(w) d w d v d \tau - \frac{x z \pi}{L_x L_y L_z} \sum_{n=1}^N a_{n \Phi I} n s_n(y) e_{n \Phi I}(t) \int_0^x \int_0^z c_n(u) c_n(w) D_{\Phi I}(u, v, w, T) d w d u d \tau - \\ & - \frac{x y \pi}{L_x L_y L_z} \sum_{n=1}^N n a_{n \Phi I} s_n(z) e_{n \Phi I}(t) \int_0^x \int_0^y c_n(u) c_n(v) D_{\Phi I}(u, v, z, T) d v d u d \tau + \int_0^x \int_0^y \int_0^z k_{I,I}(u, v, w, T) \times \\ & \times I^2(u, v, w, \tau) d w d v d u - \frac{x y z}{L_x L_y L_z} - \frac{x y z}{L_x L_y L_z} \int_0^x \int_0^y \int_0^z k_I(u, v, w, T) I(u, v, w, \tau) d w d v d u + \frac{x y z}{L_x L_y L_z} \times \\ & \times \int_0^x \int_0^y \int_0^z f_{\Phi I}(u, v, w) d w d v d u \\ & -x y z \sum_{n=1}^N \frac{a_{n \Phi V}}{\pi^3 n^3} s_n(x) s_n(y) s_n(z) e_{nV}(t) = -\frac{y z \pi}{L_x L_y L_z} \sum_{n=1}^N n a_{n \Phi V} s_n(x) e_{nV}(t) \int_0^y \int_0^z c_n(v) \int_0^z D_{\Phi V}(x, v, w, T) \times \\ & \times c_n(w) d w d v d \tau - \frac{x z \pi}{L_x L_y L_z} \sum_{n=1}^N a_{n \Phi V} n s_n(y) e_{n \Phi V}(t) \int_0^x \int_0^z c_n(u) c_n(w) D_{\Phi V}(u, v, w, T) d w d u d \tau - \end{aligned}$$

$$\begin{aligned}
 & -\frac{x y \pi}{L_x L_y L_z} \sum_{n=1}^N n a_{n \Phi_V} s_n(z) e_{n \Phi_V}(t) \int_0^{L_x} \int_0^{L_y} \int_0^{L_z} c_n(u) c_n(v) D_{\Phi_V}(u, v, z, T) d v d u d \tau + \int_0^{L_x} \int_0^{L_y} \int_0^{L_z} k_{V,V}(u, v, w, T) \times \\
 & \times V^2(u, v, w, \tau) d w d v d u - \frac{x y z}{L_x L_y L_z} \int_0^{L_x} \int_0^{L_y} \int_0^{L_z} k_V(u, v, w, T) V(u, v, w, \tau) d w d v d u + \frac{x y z}{L_x L_y L_z} \times \\
 & \times \int_0^{L_x} \int_0^{L_y} \int_0^{L_z} f_{\Phi_V}(u, v, w) d w d v d u .
 \end{aligned}$$

We determine coefficients  $a_{n \Phi_P}$  by using orthogonality condition on the scale of heterostructure. The condition gives us possibility to obtain relations to calculate  $a_{n \Phi_P}$  for any quantity  $N$  of terms of considered series. In the common case equations for the required coefficients could be written as

$$\begin{aligned}
 & -\frac{L_x^2 L_y^2 L_z^2}{\pi^5} \sum_{n=1}^N \frac{a_{n \Phi_I}}{n^6} e_{n \Phi_I}(t) = -\frac{1}{2\pi L_x} \sum_{n=1}^N \frac{a_{n \Phi_I}}{n^2} \int_0^{L_x} \int_0^{L_y} \int_0^{L_z} [1 - c_n(2x)] \left\{ L_y + y s_n(2y) + \frac{L_y}{2\pi n} [c_n(2y) - 1] \right\} \times \\
 & \times \int_0^{L_z} D_{\Phi_I}(x, y, z, T) \left\{ z s_n(z) + \frac{L_z}{2\pi n} [c_n(z) - 1] \right\} d z d y d x e_{n \Phi_I}(\tau) d \tau - \frac{1}{2\pi} \sum_{n=1}^N \frac{a_{n \Phi_I}}{n^2 L_y} \int_0^{L_y} \int_0^{L_x} \left\{ x s_n(2x) + L_x + \right. \\
 & \left. + L_x \frac{c_n(2x) - 1}{2\pi n} \right\} \int_0^{L_y} [1 - c_n(2y)] \int_0^{L_z} D_{\Phi_I}(x, y, z, T) \left\{ z s_n(z) + \frac{L_z}{2\pi n} [c_n(z) - 1] \right\} d z d y d x e_{n \Phi_I}(\tau) d \tau - \frac{1}{\pi L_x} \times \\
 & \times \sum_{n=1}^N \frac{a_{n \Phi_I}}{2n^2} \int_0^t e_{n \Phi_I}(\tau) \int_0^{L_x} \left\{ x s_n(x) + \frac{L_x}{2\pi n} [c_n(x) - 1] \right\} \int_0^{L_y} \left\{ y s_n(2y) + \frac{L_y}{2\pi n} [c_n(2y) - 1] + L_y \right\} \int_0^{L_z} D_{\Phi_I}(x, y, z, T) \times \\

 \end{aligned}$$

### 3. DISCUSSION

In this section we analyzed distribution of concentration of dopant, infused (see Fig. 2a) or implanted (see Fig. 2b) into epitaxial layer. Annealing time is the same for all curves of these figures. Increasing of number of curves corresponds to increasing of difference between values of dopant diffusion coefficients in layers of hetero structure. The figures show, that presents of interface between layers of hetero structure gives a possibility to increase absolute value of gradient of concentration of dopant in direction, which is perpendicular to the considered interface. A consequence of this result is decreasing of the dimensions of transistors included in the multi-vibrator. At the same time with increasing of the considered gradient homogeneity of concentration of dopant in enriched area.

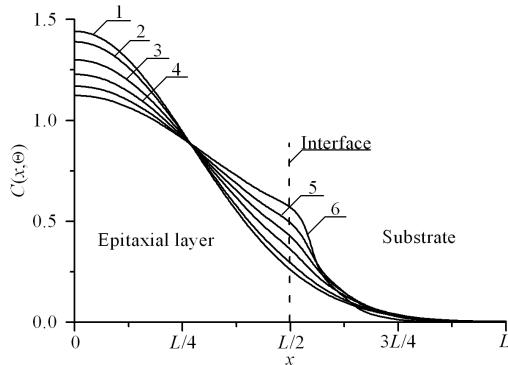

Fig.2a. Distributions of concentration of infused dopant in heterostructure from Figs. 1 in direction, which is perpendicular to interface between epitaxial layer substrate. Increasing of number of curve corresponds to increasing of difference between values of dopant diffusion coefficient in layers of heterostructure under condition, when value of dopant diffusion coefficient in epitaxial layer is larger, than value of dopant diffusion coefficient in substrate

To estimate annealing time it is necessary to estimate decreasing of absolute value of gradient of concentration of dopant near interface between substrate and epitaxial layer with increasing of annealing time. Decreasing of annealing time leads to manufacturing more inhomogenous distribution of concentration of dopant (see Fig. 3a for diffusion type of doping and Fig. 3b for ion type of doping). We determine compromise value of annealing time framework recently introduced criterion [14-20]. Frame-work the criterion we approximate real distribution of concentration of dopant by idealized step-wise function  $\psi(x,y,z)$ . Further we determine the required annealing time by minimization of mean-square error

$$U = \frac{1}{L_x L_y L_z} \int_0^{L_x} \int_0^{L_y} \int_0^{L_z} [C(x, y, z, \Theta) - \psi(x, y, z)] dz dy dx. \quad (8)$$

Dependences of optimal annealing time are shown on Figs. 4. It should be noted, that radiation defects, generated during ion implantation, should be annealed. In the ideal case after the annealing the implanted dopant should achieve the interface between layers of heterostructure. If the dopant has no enough time to achieve the interface, it is attracted an interest to make additional annealing. The Fig. 4b shows dependences of additional annealing time. Necessity of annealing of radiation defects leads to smaller value of optimal annealing time of dopant in comparison with optimal annealing time of dopant during diffusion type of doping. Diffusion type of doping did not leads to radiation damage of materials. Ion type of doping gives us possibility to decrease mismatch-induced stress in heterostructure [20].

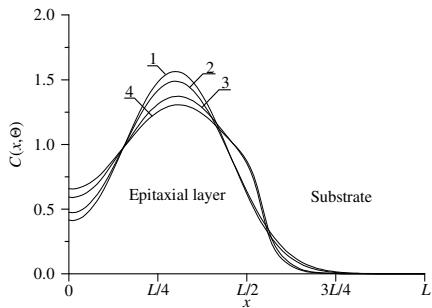

Fig.2b. Distributions of concentration of implanted dopant in heterostructure from Figs. 1 in direction, which is perpendicular to interface between epitaxial layer substrate. Curves 1 and 3 corresponds to annealing time  $\Theta=0.0048(L_x^2+L_y^2+L_z^2)/D_0$ . Curves 2 and 4 corresponds to annealing time  $\Theta=0.0057(L_x^2+L_y^2+L_z^2)/D_0$ . Curves 1 and 2 corresponds to homogenous sample. Curves 3 and 4 corresponds to heterostructure under condition, when value of dopant diffusion coefficient in epitaxial layer is larger, than value of dopant diffusion coefficient in substrate

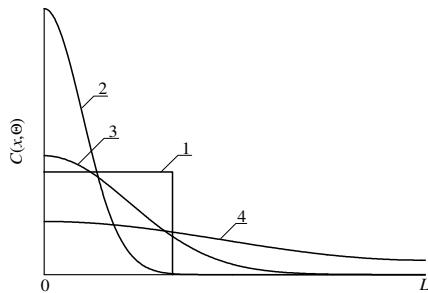

Fig. 3a. Spatial distributions of dopant in heterostructure after dopant infusion. Curve 1 is idealized distribution of dopant. Curves 2-4 are real distributions of dopant for different values of annealing time. Increasing of number of curve corresponds to increasing of annealing time

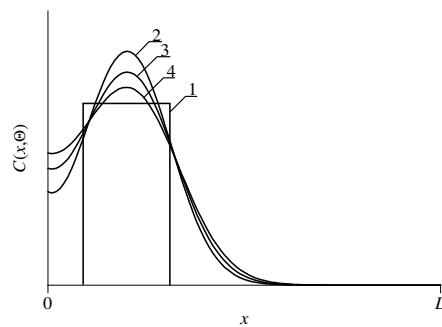

Fig.3b. Spatial distributions of dopant in heterostructure after ion implantation. Curve 1 is idealized distribution of dopant. Curves 2-4 are real distributions of dopant for different values of annealing time. Increasing of number of curve corresponds to increasing of annealing time

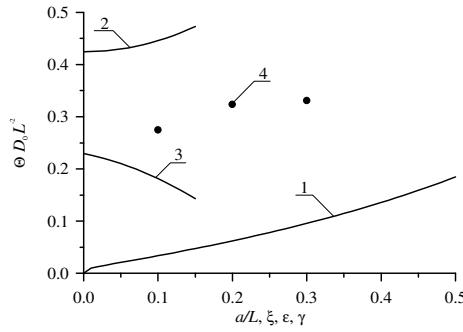

Fig.4a. Optimal annealing time of infused dopant as dependences of several parameters. Curve 1 is the dependence of the considered annealing time on dimensionless thickness of epitaxial layer  $a/L$  and  $\xi = \gamma = 0$  for equal to each other values of dopant diffusion coefficient in all parts of heterostructure. Curve 2 is the dependence of the considered annealing time on the parameter  $\varepsilon$  for  $a/L=1/2$  and  $\xi = \gamma = 0$ . Curve 3 is the dependence of the considered annealing time on the parameter  $\xi$  for  $a/L=1/2$  and  $\varepsilon = \gamma = 0$ . Curve 4 is the dependence of the considered annealing time on parameter  $\gamma$  for  $a/L=1/2$  and  $\varepsilon = \xi = 0$

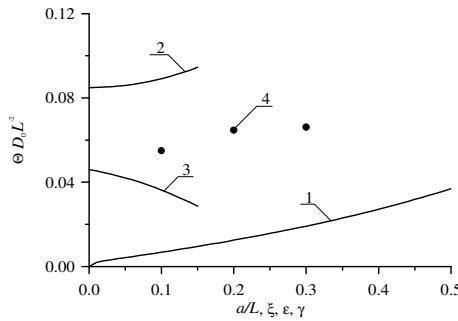

Fig.4b. Optimal annealing time of implanted dopant as dependences of several parameters. Curve 1 is the dependence of the considered annealing time on dimensionless thickness of epitaxial layer  $a/L$  and  $\xi = \gamma = 0$  for equal to each other values of dopant diffusion coefficient in all parts of heterostructure. Curve 2 is the dependence of the considered annealing time on the parameter  $\varepsilon$  for  $a/L=1/2$  and  $\xi = \gamma = 0$ . Curve 3 is the dependence of the considered annealing time on the parameter  $\xi$  for  $a/L=1/2$  and  $\varepsilon = \gamma = 0$ . Curve 4 is the dependence of the considered annealing time on parameter  $\gamma$  for  $a/L=1/2$  and  $\varepsilon = \xi = 0$

#### 4. CONCLUSIONS

In this paper prognosis of time varying of spatial distributions of concentrations of infused and implanted dopants during manufacturing a transistor multivibrator has been done. Several recommendations to optimize manufacture the heterotransistors have been formulated. Analytical approach to prognosis diffusion and ion types of doping has been introduced. The approach gives a possibility to take into account variation in space and time parameters of doped material and at the same time nonlinearity of mass and heat transport.
